Triangle with two massless external lines

$$
\begin{aligned}
I_3^{\{D=4-2\epsilon\}}(0,0,p^2;0,0,0) &= \frac{\mu^{2\epsilon}}{\epsilon^2}\left(\frac{(-p^2-i\varepsilon)^{-\epsilon}}{p^2}\right) \\
&= \frac{1}{p^2}\left(\frac{1}{\epsilon^2}+\frac{1}{\epsilon}\ln\left(\frac{\mu^2}{-p^2-i\varepsilon}\right)+\frac{1}{2}\ln^2\left(\frac{\mu^2}{-p^2-i\varepsilon}\right)\right)+\mathcal{O}(\epsilon).
\end{aligned}
$$

For $\epsilon,\varepsilon$ see the file on notation.

We also present this function with the singularities regulated with a small mass $\lambda$, (from ref. [1],Eq.(A.3))

$$
I_3^{\{D=4\}}(0,0,p^2;\lambda^2,\lambda^2,\lambda^2) = \frac{1}{2p^2}\ln^2\left(\frac{-p^2-i\varepsilon}{\lambda^2}\right)+\mathcal{O}(\lambda)
$$
